

Sobstad Fibrepath

The new generation of Sobstad sails.

Sobstad sails are produced from detailed research and development. Our design and technology programme is second to none. Innovative product development has been our foundation and we've produced winning sails from day one (that was 25 years ago). We've provided a benchmark to the industry.

North saw the importance of that technology and bought Sobstad patents to underpin their own offer.

Now we have raised the performance bar further with our revolutionary patented Fibrepath sail.

Fibrepath is a custom sail laminate where two outer surfaces are laminated over load bearing fibres that are applied to follow pre determined load paths. Each fibre is laid in a perfect catenary curve which aligns with the dynamic loads in the sail. Fibrepath offers the largest choice of Fibre, film and taffeta as well as a superior quality lamination.

Sobstad designers have total control of the fibre layout and density producing a sail that is light, smooth and superior in shape retention.

Build your success on Fibrepath foundations.
